

Anwendungsbeispiel 2

```
Table <Student> m(50);
Student rm;
if (m.First())
{
    while (m.Next())
    {
        m.GetNode(rm);
        if (rm.Get_Studiengang() == 2)
        {
            cout << „Note von“ << rm.Get_Mat-Nummer();
            cout << „ist“ << rm.Get_Note() << endl;
        }
    }
};
```

```
class Student
{
public:
    enum Studiengang (GE, Inf);
    int Get_Matnummer ( return Matnummer;);
    char* GetName { return Name;};
    float Get_Note { return Note;};
private:
    char Name[30];
    int Matnummer;
    float Note;
}
```
